

Pick Your Poison

A cocktail of primary greenhouse gases mixed with lethal chemicals, topped with a hint of irony.

A cocktail of primary greenhouse gases mixed with lethal chemicals, topped with a hint of irony.

Hosted by: Isolda Strom

Project Information (EN)

Instant death or slow and painful decline?

Dimethylcadmium is a volatile organic compound. It absorbs instantly into the bloodstream and rips apart the organs that need the highest supply of blood, including the heart and the lungs. A very small amount is instantly lethal. Carbon Dioxide (CO₂) is a chemical compound we encounter every day. In fact we expel it in each breath we take. It is also a greenhouse gas, which has risen steadily in our atmosphere mainly due to burning fossil fuels, causing global warming and climate change as well as ocean acidification.

What is your poison of choice?

Mankind has always gravitated towards danger, what is your poison of choice?
