

Myamo

An acoustic panel made from mushrooms.

Myamo

Hosted by: Katharina Querbach

Project Information (EN)

From Nature to your Home

Myamo is a high-performance, aesthetic and sustainable acoustic panel that is created in a growth process based on mycelium, the underground root structure of mushrooms in combination with agricultural waste. The surface structure captures sound waves for us to feel comfortable and work productively in open-plan offices, co-working spaces or home offices. A minimalist, aesthetic and sustainable solution to improve room acoustics.

Functional, aesthetic & sustainable

Myamos panels are acoustically absorbent, 100 percent biodegradable, without chemical additives, naturally fire resistant and very lightweight. Inspired by Nature's cell structures such as a turtle shell's pattern, the parametric surface gradient ensures optimal noise reduction. The system of three different modules allows for horizontal and vertical expansion and allows for customization of an overall relief-like appearance. Myamo, an acoustic panel that combines the desires, trends and requirements of the 21st century in one product.
